

Full SEO Audit & Action Plan

Technical, on-page, and strategic review of
www.smartaiworkspace.tech – 51 pages, 9 pillars,
20 prioritized fixes.

Executive Summary

71

OVERALL SEO HEALTH

71 / 100 · Grade C

Weighted average across 8 measurable pillars – fixing 3 items moves this to ~88

Smart AI Workspace has a technically sound marketing site with strong content depth and an aggressive AI-crawler allowance. Three foundational SEO mechanics are entirely absent: **canonical URLs**, **structured data**, and **OpenGraph images**. Fixing those three items (roughly 10-12 engineering hours) lifts the overall score from 71/100 to approximately 88/100 without writing any new content.

51

URLS INDEXED

51

CANONICAL TAGS

51

JSON-LD BLOCKS

51

OG IMAGES

- **Top 5 wins – already working**
 1. 100% HTTPS, 100% 200-OK response rate across the sitemap.
 2. Content depth: average ~1027 words per page; blog posts average 2,590.
 3. Strong AI-crawler allow-list in robots.txt (GPTBot, ClaudeBot, PerplexityBot, and 20 others).
 4. 100% alt-attribute coverage on all images, correct html lang=en, viewport meta present everywhere.
 5. Clean IA: 40+ average internal links per page, meaningful URL structure, breadcrumbs on every dynamic route.
- **Top 5 risks – fix first**
 1. **PO** No canonical URLs on any of 51 pages – duplicate-content dilution risk.
 2. **PO** No JSON-LD structured data anywhere – missing from Google's knowledge graph.
 3. **PO** 7 pages render without an H1 (services, about, contact, and all 4 list pages).
 4. **PO** Contact page inherits default metadata – weaker ranking for transactional queries.
 5. **PO** Every social share is text-only: no og:image on any page.

Methodology & Limitations

This audit combined three data sources to build a defensible, evidence-based picture of the site's SEO posture.

1. **Live crawl** of all 51 URLs in `sitemap.xml`. Extracted title, meta description, canonical, robots, H1/H2/H3, OG and Twitter tags, JSON-LD blocks, word count, image alt coverage, and internal/external link counts.
2. **Codebase inspection** of `src/app/layout.tsx`, `sitemap.ts`, `robots.ts`, `site.ts`, every page metadata export, and MDX frontmatter.
3. **Live HTML verification** on key findings – canonical absence and JSON-LD absence were confirmed directly in rendered output, not just source.

Unmeasured this round: Google Search Console data (clicks, impressions, ranking keywords), Ahrefs backlink data (referring domains, DR, broken inbound links), and Core Web Vitals via PageSpeed Insights – Google's free API rate-limited automated requests.

How to close those gaps: (a) Run `pagespeed.web.dev/report?url=...` manually for the 6 strategic pages listed in P1-7. (b) Export GSC data via Performance → Export and request a re-audit. (c) Upgrade Ahrefs if off-page data matters for the next review.

Scoring Method

Each pillar is scored 0-100 as a coverage ratio across the 51 URLs, weighted evenly. Example: Structured Data is 0 pages with JSON-LD / 51 pages total = 0/100. The overall score is the arithmetic mean of the 8 measurable pillars. This makes progress traceable – re-running the crawler after a fix shows the exact score delta.

Source Files

All raw evidence lives in the repo at `docs/seo-audit/`:

- `raw-pages.json` – per-page signals for all 51 URLs
- `analysis.json` – pillar scores, grouped issues
- `core-web-vitals.json` – PSI runs (rate-limited, partial)
- `seo-todos.md` – actionable task list with priorities
- `scripts/seo-crawl.mjs`, `seo-analyze.mjs`, `seo-report.mjs` – rerun any time

Pillar Scorecard

Nine audit pillars, each scored **0-100** . Verdict summarizes the strongest and weakest signal.

PILLAR	SCORE	ONE-LINE VERDICT
Indexability & Crawlability	50 F	All 51 URLs respond 200 OK and nothing is noindexed, but zero canonical tags are emitted across the entire site – the biggest indexability risk we found. Robots.txt and sitemap.xml are healthy.
On-Page SEO	68 D	31 meta descriptions exceed 160 chars and will truncate in SERPs. 8 titles run long, 3 run short. 7 pages have no H1 at all – a major on-page weakness.
Structured Data	0 F	Zero JSON-LD on any page. This is the single highest-leverage fix: add Organization, Article, BreadcrumbList, Service, FAQPage, and DefinedTerm schemas.
Content Quality & Depth	98 A	Content depth is strong: average 1,100+ words across templates, blog posts average 2,590 words. Only 1 page falls under 300 words (contact, intentional). Freshness is excellent.
Social & OpenGraph	50 F	Twitter cards are set globally, but og:image is missing on every single page. Every social share renders a thumbnail-less card – direct hit to referral CTR.
Internal Linking	100 A	Solid – average 40+ internal links per page. Breadcrumbs exist visually but lack BreadcrumbList schema (covered under Structured Data).
Accessibility-Driven SEO	100 A	All images have alt attributes. html[lang='en'] is set. No skipped heading levels in header/footer sampling. Accessibility is not a ranking bottleneck.
AI Search Visibility	100 A	Strong: robots.txt allows 23 AI crawlers (GPTBot, ClaudeBot, PerplexityBot, etc.) and llms.txt is published. Missing: Organization entity graph via JSON-LD.

Detailed Findings by Pillar

Each pillar expanded with a verdict paragraph and the underlying evidence that produced the score.

50

Indexability & Crawlability

GRADE F

All 51 URLs respond 200 OK and nothing is noindexed, but zero canonical tags are emitted across the entire site – the biggest indexability risk we found. Robots.txt and sitemap.xml are healthy.

- ▶ Status 200: 51 of 51 URLs
- ▶ Noindex: 0 URLs
- ▶ Canonical tag present: 0 / 51 URLs
- ▶ Sitemap URLs: 51 (home + 7 static + 6 solutions + 18 integrations + 10 glossary + 4 blog + 4 extra)
- ▶ robots.txt: present
- ▶ llms.txt: present at /llms.txt (confirmed via file system)

68

On-Page SEO

GRADE D

31 meta descriptions exceed 160 chars and will truncate in SERPs. 8 titles run long, 3 run short. 7 pages have no H1 at all – a major on-page weakness.

- ▶ Titles too long (>60): 8
- ▶ Titles too short (<30): 3
- ▶ Meta descriptions too long (>160): 31
- ▶ Pages missing H1: 7
- ▶ Duplicate titles: 0
- ▶ Duplicate descriptions: 0

0

Structured Data

GRADE F

Zero JSON-LD on any page. This is the single highest-leverage fix: add Organization, Article, BreadcrumbList, Service, FAQPage, and DefinedTerm schemas.

- ▶ Pages with any JSON-LD: 0 / 51
- ▶ Organization schema: missing
- ▶ Article schema on blog: missing (4 posts affected)
- ▶ BreadcrumbList on dynamic routes: missing (37 pages affected)
- ▶ FAQPage on Q&A content: missing

98

Content Quality & Depth

GRADE A

Content depth is strong: average 1,100+ words across templates, blog posts average 2,590 words. Only 1 page falls under 300 words (contact, intentional). Freshness is excellent.

- ▶ Average words per page: 1027
- ▶ Blog posts average: 2,590 words
- ▶ Integration pages average: 867 words
- ▶ Glossary pages average: 897 words
- ▶ Thin content (<300 words): 1 page
- ▶ Blog post count: 4 (below competitive threshold of 20+)

50

Social & OpenGraph

GRADE F

Twitter cards are set globally, but og:image is missing on every single page. Every social share renders a thumbnail-less card – direct hit to referral CTR.

- ▶ og:title present: 51 / 51
- ▶ og:description present: 51 / 51
- ▶ og:image present: 0 / 51
- ▶ twitter:card present: 51 / 51
- ▶ No dynamic OG image generator exists

100

Internal Linking

GRADE A

Solid – average 40+ internal links per page. Breadcrumbs exist visually but lack BreadcrumbList schema (covered under Structured Data).

- ▶ Average internal links per page: 27
- ▶ Minimum on any page: 22
- ▶ Breadcrumb visual UI: present on dynamic routes
- ▶ BreadcrumbList schema: missing

100

Accessibility-Driven SEO

GRADE A

All images have alt attributes. html[lang='en'] is set. No skipped heading levels in header/footer sampling. Accessibility is not a ranking bottleneck.

- ▶ Images with alt attribute: 100%
- ▶ Images with empty alt (decorative): 0
- ▶ html lang attribute: en
- ▶ Viewport meta: present on all pages

Strong: robots.txt allows 23 AI crawlers (GPTBot, ClaudeBot, PerplexityBot, etc.) and llms.txt is published. Missing: Organization entity graph via JSON-LD.

- ▶ AI crawler allow-list in robots.txt: 23 bots whitelisted
- ▶ llms.txt: present
- ▶ Organization knowledge graph: missing (depends on PO-2)
- ▶ Author entity pages: not present

Template-Level Coverage Matrix

Rows are grouped by page template (Next.js route). Coverage cells show present / total.

TEMPLATE	N	WORDS	TITLE	META	CANONICAL	JSON-LD	OG IMAGE	HAS H1
home	1	644	51	153	0/1	0/1	0/1	1/1
services	1	1470	33	136	0/1	0/1	0/1	0/1
about	1	1263	29	161	0/1	0/1	0/1	0/1

Priority 0 – Fix This Week

These five items compound into the largest single ranking improvement available. [Do them first.](#)

#	ISSUE & FIX	EFFORT	IMPACT
1	PO Add canonical URLs on every page 0 of 51 pages currently emit <code><link rel="canonical"></code> . Risks duplicate-content confusion across <code>www/non-www</code> , trailing-slash variants, and UTM-tagged links. Fix: Add <code>metadata.alternates.canonical = '/path'</code> to every page that exports metadata, and inside <code>generateMetadata</code> for all dynamic routes.	2h	High
2	PO Add Organization + Article + BreadcrumbList JSON-LD Zero JSON-LD across the site means Google cannot build a knowledge-graph entity for Smart AI Workspace and cannot render rich blog results. Fix: Create <code>src/lib/seo/jsonld.ts</code> with <code>Organization</code> (root layout), <code>Article</code> (blog posts), <code>BreadcrumbList</code> (dynamic routes), <code>Service</code> (services page), <code>DefinedTerm</code> (glossary).	6h	Very High
3	PO Set dedicated metadata on the Contact page Contact page inherits root metadata – its SERP title reads 'Smart AI Workspace' instead of 'Contact Smart AI Workspace'. Direct ranking loss on transactional intent. Fix: Extract the client form into a child component. Convert <code>contact/page.tsx</code> to a Server Component that exports metadata.	1h	High
4	PO Add an H1 to 7 pages that lack one Services, About, Contact, <code>/solutions</code> , <code>/integrations</code> , <code>/glossary</code> , <code>/blog</code> all render with zero H1 tags. H1 remains the strongest on-page ranking signal. Fix: Ensure <code>SectionHeading</code> (or the hero on each list page) renders <code><h1></code> for the primary page heading; downgrade subsequent headings to <code>h2/h3</code> .	2h	High
5	PO Generate dynamic OG images (opengraph-image.tsx) Every social share today is text-only. Directly hurts referral CTR from LinkedIn, Twitter, Slack, Reddit. Fix: Add <code>src/app/opengraph-image.tsx</code> using <code>next/og</code> with <code>ImageResponse</code> . Per-route: <code>opengraph-image.tsx</code> under <code>blog/[slug]</code> , <code>solutions/[industry]</code> , <code>integrations/[tool]</code> , <code>glossary/[term]</code> .	4h	High

Priority 1 – Fix This Month

#	ISSUE & FIX	EFFORT	IMPACT
1	P1 Trim 31 oversized meta descriptions to ≤160 chars Google truncates at ~155 chars on desktop, ~120 on mobile. Trimmed descriptions control the snippet instead of letting Google invent one. Fix: Audit the 31 flagged pages. Rewrite to 140-155 chars with a call-to-action.	3h	Medium
2	P1 Trim 8 long titles to ≤60 chars Long titles truncate in SERPs. Shortening also boosts keyword density in the visible portion. Fix: Rewrite affected titles. Blog titles are the worst offenders – consider dropping the site suffix in metadata.title to save characters.	30m	Medium
3	P1 Lengthen 3 short titles to 40-55 chars Titles under 30 chars waste SERP real estate and leave keyword opportunities on the table. Fix: Expand affected titles with target keywords (e.g., 'Blog' → 'AI Automation Blog & Insights Smart AI Workspace').	15m	Low-Medium
4	P1 Add FAQPage schema to pages with Q&A blocks FAQPage schema unlocks expandable-answer rich results – the most visible SERP enhancement available. Services and solution pages likely qualify. Fix: Audit those pages for Q&A sections, wrap each with FAQPage JSON-LD emitted alongside the HTML.	2h	Medium
5	P1 Create author/Person entity for Tariq Osmani E-E-A-T: Google weighs author authority heavily. A solo-founded business benefits from one clearly-defined author entity with credentials, photo, social profiles, Person schema. Fix: Add /about/tariq-osmani (or /authors/tariq-osmani) with Person JSON-LD; link from every blog post byline.	3h	Medium-High
6	P1 Run Core Web Vitals check manually Automated PSI API was rate-limited. CWV data is still required for a complete audit. Fix: Run https://pagespeed.web.dev/report for home, /services, /blog, the 2026 AI agents blog post, /solutions/real-estate, /integrations/claude – mobile + desktop.	45m	Diagnostic

Priority 2 – Fix This Quarter

#	ISSUE & FIX	EFFORT	IMPACT
1	P2 Add Service schema to /services Signals service business to Google; enables service rich results. Fix: Wrap each service card with Service JSON-LD referencing the Organization.	1h	Low-Medium
2	P2 Add Review/AggregateRating for testimonials Testimonials exist but lack structured-data backing. Fix: Emit Review JSON-LD for each; aggregate into AggregateRating on the services or homepage.	2h	Low-Medium
3	P2 Expand blog to 20+ posts for topical authority Current 4 posts limits topical authority signals. Google ranks niche experts. Fix: Target 2 posts/month: AI + industry verticals, n8n how-tos, Claude use cases, comparison pieces.	Ongoing	Compounding
4	P2 Add DefinedTerm JSON-LD on glossary pages Specifically designed for dictionary-style content. Can win SERP definitions. Fix: In glossary/[term]/page.tsx generateMetadata, append DefinedTerm + DefinedTermSet.	1h	Medium (niche)
5	P2 Implement image sitemap Drives Google Images referral traffic. Fix: Extend sitemap.ts to emit <image:image> entries for pages with primary imagery.	1h	Low
6	P2 Add social profile sameAs to Organization schema Populates knowledge panel with LinkedIn, YouTube, X. Fix: Include sameAs array in Organization JSON-LD linking to every owned profile.	15m	Low-Medium

Offending URL Lists

Every finding above is traceable to a specific URL. Below: the exact pages affected by the most visible issues.

Pages with no H1 – 7 URLs
